

### **Metropolitan Planning Council**

#### Drinking Water 1-2-3 Academy

### Building the Foundation for Equitable Water Rates

July 23, 2019

### Agenda

1 – Revenue Requirements

- 2 Cost of Service Analysis
- 3 Rate Design Analysis
- 4 Questions

Source: American Water Works Association Manual of Practice M1: Principles of Water Rates, Fees, and Charges

# **Revenue Requirements**

### Water Revenue Requirements

- Used to calculate sufficient funding for water utility
- Identified and performed in accordance with American Water Works Association Manual of Practice M1: Principles of Water Rates, Fees, and Charges
- Revenue Requirements
  - Operation and maintenance (O&M) expenses
  - Debt service or loan payments
  - Minor equipment or capital repair and replacement
  - Major cash funded capital
  - Transfer to/from reserves
  - Payments in lieu of taxes

# Revenue Requirement Components

### Why a Rate of Return?

- 1. Recovery of debt financing costs
- 2. Compensates for opportunity costs (if no debt)
- **3.** Provides fair compensation for:
  - Use of the City's borrowing capacity
  - Ownership risks of providing service to Outside-city customers

## **Ownership Risks**

Risk of liability and civil penalties related to system operations and construction activities.

Risk of unexpected expenses due to regulation changes or service demographics resulting in cost recovery lag.

## **Revenue Requirements: Case Study**

- Hybrid approach was used to determine revenue requirements
- Revenue requirements for Outside-city customers was calculated with utility basis approach
- Revenue requirements for Inside-city customers developed on cash needs basis and subtracting Outside-City revenue requirements

| Cash Needs Approach               | Utility Basis Approach        |
|-----------------------------------|-------------------------------|
| O&M Expense                       | O&M Expense                   |
| + Pay-As-You-Go Capital           | + Depreciation                |
| + Debt Service Expense            | + Outside-City Rate of Return |
| +-Sources (Uses) of Cash Reserves | + Inside-City Rate of Return  |
| Annual Revenue Requirement        | Annual Revenue Requirement    |

#### Hybrid Approach

Cash Needs Revenue Requirement = Utility Basis Revenue Requirement (by adjusting the inside-city rate of return)

### **Revenue Requirements: Case Study**

# **Cost of Service Analysis**

### **Cost of Service Analysis**

- The cost of service analysis step is used to allocate revenue requirements to customer classes in a fair and equitable manner.
- Two methods for assigning costs:
  - 1. Base-excess capacity
  - 2. Commodity-demand method
- Case study uses base-excess capacity method

Both distribute revenue requirements to customers based on costs incurred to meet their specific needs.

### **Cost Allocation Framework**

### **Functional and Cost Category Allocation**

- Functional categories are defined by type of operation within the water utility
- Cost categories identify cost drivers imposed on the system by different types of customers

# Facilities are designed to meet cost drivers and expenses are linked to service requirements.

## **Allocation to Cost Categories**

- Base Costs Include costs associated with handling average daily water demands (i.e. costs that vary with the amount of water consumption).
- Maximum Day Extra Capacity Costs Include costs associated with providing system capacity to meet maximum day water demands ("MDD") in excess of average daily demands.
- Maximum Hour Extra Capacity Costs Include costs associated with providing system capacity to meet maximum hour water demands ("MHD").
- Customer Costs Include costs that vary in proportion to the number or type of customers served.
- Billing Costs Include costs associated with preparing and issuing customer bills and applying payment as it is received.
- Equivalent Meter Costs Include costs associated with services where the costs vary by the size of the meter or service line. Examples of such costs include the cost to maintain, service, and replace water meters.
- Fire Protection Costs Include costs related to providing fire protection to system customers. Such costs include maintaining and servicing fire hydrants in a manner sufficient to provide fire suppression capabilities throughout the City.

### **O&M Cost Allocation – Case Study**

| Functional Category          | Allocation  | Rationale   |
|------------------------------|---|---|
| Source of Supply             | 100% Base   | Source of supply facilities are designed to meet total supply requirements.   |
| Treatment                    | 63% Base<br>37% MDD   | Designed to meet maximum daily demands.   |
| Transmission / Distribution  | 27.9% Base (AII)<br>15.9% MDD (AII)<br>6.0% MHD (AII)<br>15.3% Base (Inside)<br>8.7% MDD (Inside)<br>3.3% MHD (Inside)<br>10.9% Base (Outside)<br>6.2% MDD (Outside)<br>2.3% MHD (Outside)<br>2.6% Eq Meter<br>0.9% Fire Protection | Allocated based on the weighted average of<br>transmission, distribution, pump stations, meters,<br>and hydrant capital cost allocations. |
| Customer Service and Billing | 100% Number of Bills  | Customer service and billing is a function of the<br>number of customers that are served and the<br>number of bills that are issued.      |
| Meters                       | 75% Equivalent Meters<br>25% Number of Customers  | Meter maintenance costs are based on the size of the meter installed and number of customers.   |
| Administration and General   | Average   | Allocated based on the weighted average of all other locations.   |

#### Percentages determined from operating history or design.

### **Units of Service**

|                          |            |         | Γ      | Max Day (MD) | )         | . N    | lax Hour (M |           |         |            |
|--------------------------|------------|---------|--------|--------------|-----------|--------|-------------|-----------|---------|------------|
|                          | Annual     | Avg Day |        | Total        | Extra     |        | Total       | Extra     |         |            |

# **Rate Design Analysis**

### **Rate Design Objectives**

Pricing objectives for the case study:

- Ensure equitable recovery of water system costs from customers
- Maintain contract and non-contract rate multipliers with Outside-city customers
- Maintain or enhance stability of water revenues

#### Utility rates are a function of costs and customer demands.

### **Rate Design Analysis**

Water rate design alternatives to align existing rates and charges with cost of service results:

- Across-the-board rate increase.
- Increase billing and service charges by 15% and keep commodity rates the same for an overall increase of 3%.
- Adjust billing and service charge ratios to better align charges with cost of service results and increase them for an overall rate increase of 3%. Commodity rates would stay the same.
- Overall rate increase of 3% was applied to billing and service charges and commodity rates by limiting the increase of billing and service charges to 10%.

Rate design alternatives provide different levels of revenue stability based on how fixed charges are increased.

### **Utility basis approach benefits**

Has benefit of smoothing out revenue requirements and provides for compensation for borrowing capacity and risk

Rate of return recovers financing costs and can compensate for contractual, financial, litigation, and business risks

# **Common Methods of Determining Cost of Equity**

- 1. Equity returns approved by Public Service Commissions
  - Ohio American Water Company (7.47% in 2014)
- 2. US Treasury Rate + Risk Premium
  - Treasury Rate Currently 2.52% (10-17-16)
- 3. Debt Interest Cost x Multiplier
  - Utility's Weighted Debt Interest Cost = 4.0%

# **Utility Basis Example 1**

Assumptions:

City incurs \$1 million in capital cost

Pays for the project with cash

Capital asset has a 10-year life

Question:

How would the recover the cost using a utility basis approach?

### a. Examine the Project Cash Flow

### **b. Forecast Depreciation** Depreciation = Return <u>of</u> Capital

|                 | Y0          | Y1      | Y2      | Y3      | Y4      | Y5      | Y6      | Y7      | Y8      | Y9      | Y10 |
|-----------------|-------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|-----|
| Net Asset Value | \$1,000,000 | 900,000 | 800,000 | 700,000 | 600,000 | 500,000 | 400,000 | 300,000 | 200,000 | 100,000 | \$0 |
| ROR             | 50,000      | 45,000  | 40,000  | 35,000  | 30,000  | 25,000  | 20,000  | 15,000  | 10,000  | 5,000   | \$0 |

Assume Rate of Return = 5%

### d. Examine the Total City Cash Flow

|                | Y0           | Y1       | Y2       | Y3       | Y4       | Y5       | Y6       | ¥7      | Y8      | Y9      | Y10     |
|----------------|--------------|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|
| Capital Cost   | -\$1,000,000 |          |          |          |          |          |          |         |         |         |         |
| Cost Recovery: |              |          |          |          |          |          |          |         |         |         |         |
| Depreciation   |              | 100,000  | 100,000  | 100,000  | 100,000  | 100,000  | 100,000  | 100,000 | 100,000 | 100,000 | 100,000 |

| Total          | 50,000       | 145,000  | 140,000  | 135,000  | 130,000  | 125,000  | 120,000  | 115,000 | 110,000 | 105,000 | 100,000 |
|                |              |          |          |          |          |          |          |         |         |         |         |
| Cumulative     | -950,000     | -805,000 | -665,000 | -530,000 | -400,000 | -275,000 | -155,000 | -40,000 | 70,000  | 175,000 | 275,000 |

# **Utility Basis Example 2**

Assumptions:

City incurs \$1 million in capital cost

Pays for the project with debt

Terms of debt (7 years at 3.5% interest)

Capital asset has a 10-year life

Question:

How would the recover the cost using a utility basis approach?

### a. Examine the Project Cash Flow

#### **Debt Service Capital Investment**

Amount Financed: \$1,000,000 Interest Rate: 3.5% Term: 7 years Issuance Cost = 1%

Annual Debt Service = \$165,180

### **b. Forecast Depreciation** Depreciation = Return <u>of</u> Capital

|                 | Y0          | Y1      | Y2      | Y3      | Y4      | Y5      | Y6      | Y7      | <b>Y8</b> | Y9      | Y10 |
|-----------------|-------------|---------|---------|---------|---------|---------|---------|---------|-----------|---------|-----|
| Net Asset Value | \$1,000,000 | 900,000 | 800,000 | 700,000 | 600,000 | 500,000 | 400,000 | 300,000 | 200,000   | 100,000 | \$0 |
| ROR             | 50,000      | 45,000  | 40,000  | 35,000  | 30,000  | 25,000  | 20,000  | 15,000  | 10,000    | 5,000   | \$0 |

Assume Rate of Return = 5%

Same as Example 1 – No change

### d. Examine the Total City Cash Flow

|                | <b>Y0</b> | Y1       | Y2       | Y3       | Y4       | Y5       | Y6       | Y7       | Y8      | Y9      | Y10     |
|----------------|-----------|----------|----------|----------|----------|----------|----------|----------|---------|---------|---------|
| Capital Cost   |           | -165,180 | -165,180 | -165,180 | -165,180 | -165,180 | -165,180 | -165,180 |         |         |         |

| Cumulative     | 50,000    | 29,820   | 4,640    | -25,540  | -60,720  | -100,900 | -146,080 | -196,260 | -86,260 | 18,740  | 118,740 |

# Summary of the Utility Basis ARCADIS Capital Cost Recovery Approach

 Capital costs allocated based on depreciation expense and return on rate base.

Reason for Using the Utility Basis Approach

- 1. Results in more stable revenue requirements than the cash basis
- 2. Outside-city cost share less dependent on City's capital financing decisions
- 3. Provides mechanism to compensate City for risk and opportunity cost

| Rate of Return |  |
|----------------|--|
| Depreciation   |  |
| O&M            |  |
|                |  |
